
A
Target: current period R_t
Few cases
Many cases
Period
Error shrinks to 0 as cases grow
Target: mean across periods $\bar{R}$
between-period variance v_R
$\bar{R}$
Period
Error levels off at v_R as cases grow
B
Mean squared error of the period estimate
10^0
10^{-1}
10^{-2}
10^{-3}
10^{-4}
10^{-5}
$m_\times = 53.1$
$v_R = 0.04$
Target R_t
Target $\bar{R}$
Simulation
10^1
10^2
10^3
Expected reported cases per period, m
